

Customer Support Ticket Analysis

1. Project Overview

The primary goal of this project is to analyze customer support ticket data using Python data structures (Lists and Dictionaries). The script categorizes tickets based on priority levels and identifies cases requiring detailed attention by measuring issue description length.

2. Key Results

- **Priority Distribution:**
 - **High Priority:** 4
 - **Medium Priority:** 3
 - **Low Priority:** 3
 - **Total Tickets Analyzed:** 10
- **Longest Issue Description Details:**
 - **Ticket Number:** TCK101
 - **Customer Name:** Arun
 - **Cleaned Issue:** Payment got debited from account but order status shows failed
 - **Word Count:** 10 words

3. Tech Stack & Concepts

- **Language:** Python 3.x
- **Data Structures:** Dictionary, List
- **Control Flow:** for loop, if conditions, enumerate(), len(), split()

4. Conclusion

This automated Python script successfully classifies support workload by priority and isolates complex customer issues. These insights help support teams streamline response strategies and address high-priority tickets efficiently.
